

MARKET VALUE OF THE COMPANY

LEARNING OBJECTIVES

- Understand the most commonly used business valuation methods.
- Know how to value a company using the multiples approach.
- Know how to value a company using the discounted cash flow approach.

A WORD FROM THE AUTHOR – Michel TERNISIEN

« Appraisers pursue a specific objective: to use a range of different approaches to calculate a value for the company assigned to them for appraisal. At the end of their work, they propose an estimate of the company's "market value". This estimate will serve as a starting point for discussions between the seller and buyer.

Appraisers must therefore draw out the full potential of the business they are appraising. A single approach will not satisfy this objective, several approaches are required. Because of this, appraisers are required to implement several valuation methods.

In this course, I will help you to explore the two valuation methods most commonly used by valuation professionals: valuation multiples and discounted cash flows (DCF). ».
